

# PART I: NON-RIEMANNIAN HYPERSQUARES

Math 256C: From Schemes to Machinations

Fall 2020

## Lecture 1: 26 August

PROFESSOR ALEXANDER GROTHENDIECK

ABHISHEK SHIVKUMAR

## Tutorial

Here is where lecture content goes, generally a summary or transcription of what is being said or written. Here is a theorem:

**Theorem 1.1.1: Kontsevich**

The number  $N_d$  of rational plane curves of degree  $d$  passing through  $3d - 1$  points in general position is given recursively by

$$N_d = \sum_{d_A + d_B = d} N_{d_A} N_{d_B} d_A^2 d_B \left( d_B \binom{3d-4}{3d_A-2} - d_A \binom{3d-4}{3d_A-1} \right)$$

The above result, is, of course, thoroughly unrelated to the following fact:

**Lemma 1.1.2**

In a  $k$ -free graph on  $n$  vertices, there are at most  $\binom{k-1}{r} \left(\frac{n}{k-1}\right)^r$   $r$ -cliques.

Setting  $r = 2$  in the above, we recover the following result:

**Corollary 1.1.3: Turan's Theorem**

In a  $k$ -free graph on  $n$  vertices, there are at most  $\frac{k-2}{k-1} \frac{n^2}{2}$  edges.

You can reference any theorem box if you add a reference tag (see the  $\LaTeX$  code at Corollary 1.1.3 for formatting, and see the style file for the reference prefixes for each theorem style).

Unnumbered versions of all the theorem boxes exist:

**Proposition: Hurwitz**

hurwitz The group of orientation-preserving conformal automorphisms of a compact Riemann surface of genus  $g > 1$  has order at most  $84(g - 1)$ .

**Proof:** There is also a proof environment. ■

Here is a margin note: note that the above result was only obtained in the early 1990s, using ideas from theoretical physics.

Note that this upper bound can be mildly strengthened into a strict upper bound by considering the different cases for  $n$  modulo  $k - 1$ . In particular, if  $r$  is the remainder when  $n$  is divided by  $k - 1$ , then the upper bound on edges is

$$\frac{k-2}{k-1} \frac{n^2 - r^2}{2} + \binom{r}{2}$$

and  $k$ -free graphs with precisely that many edges can be straightforwardly constructed.

References do not work for unnumbered theorems.

Some miscellaneous things:

Associativity of the product arising from a 2D TQFT.

Using <https://q.uiver.app/> (whose style file is included in our style file for convenience), we can curve arrows more flexibly in commutative diagrams than tikz-cd normally allows:

$$\begin{array}{ccccc}
 & \mathbb{P}^n \setminus \{Q\} & \xrightarrow{\varphi_0} & W_0 & \\
 & \uparrow & & \uparrow & \\
 X & \xrightarrow{\quad} & \mathbb{P}^n \setminus V & \xrightarrow{\varphi_0|_{\mathbb{P}^n \setminus V}} & W_0 \setminus V' \xrightarrow{\varphi'} W \\
 & \searrow & \varphi & & 
 \end{array}$$

#### Question 1.1.4

Are these diagrams really necessary to include in a sample file?
